How to connect to a database using LDAP

How to use LDAP to connect to a database - for example, to an Oracle DB.

The URL connection-string could possibly be best formed as:

```java
String url = "jdbc:oracle:thin:@ldap://" + ldapHost + "/" + instance + ldap_context;
```

and look like:

```java
String url = "jdbc:oracle:thin:@ldap-server:389/testInstance,CN=Admin,O=myOrganization,C=AB";
```

This string could then be included in one of our JITL jobs. Either:

- **PLSQL job** or
- **SQLPlus job**

  The user ID and password along with the URL would then be included in the job parameters.
