How to check output to stdout from an SSH job

- If you want to check the output from the SSH JITL Job then you can do this in a job chain with a step after the SSH JITL Job.
- The SSH JITL Job provides an order parameter that returns output to stdout which can be examined. You could then continue the processing of the job chain at different nodes depending on the results that have been found in stdout.
- Have a look at the example that is available here: ssh_stdout_example.zip
- Please note that you have to configure host, user and password in the SSH job. The configuration is given in the node configuration file.
