

How to start a job chain with a time event and only when another job chain has finished

- [Problem:](#)
- [Solution:](#)

Problem:

You have two job chains. Each of them should start on a specific schedule. But the second job chain should only start when the first is completed.

Solution:

Add a sync node at the end of the first job chain and at the start of the second job chain. Please add a dummy start node at the begin of the second job chain as a workaround for [JITL-88](#).

You can download the source for this example from [here](#).
